- 1 Quiz Questions
- 2 Pseudocode
- 3 Example
 - Complete Binary Trees and Frequencies
 - Encoding and Decoding
- 4 Test Results
- 5 Q&A

1. What specific type of Binary Tree is used in the implementation of the BCCBT Data Compression Algorithm? Describe at least one discussed property of this type of Binary Tree.
2. Given the specific binary tree needed for the BCCBT algorithm, where the tree's nodes correspond to symbols in an arbitrary alphabet Σ . Denote a symbol ϕ , such that ϕ is in our arbitrary alphabet Σ . Note, ϕ is **NOT** the root of the tree. How is the bit code generated for the symbol ϕ ?
3. Does the BCCBT Data Compression Algorithm make use of the frequency/probability of each unique symbol in the source file? Explain why or why not.

Bit Code Complete Binary Tree (BCCBT)

PSEUDOCODE OF THE BCCBT ALGORITHM

ENCODING

```
Get the frequency of each symbol from the input stream
Set the frequency table to the frequency of each symbol
Create a complete binary tree using the frequency table
Set the bit codes according to where the symbols are in the tree
While more symbols to read from the input stream
    Read one symbol from the input stream
    Write the symbol's bit code to the bit code stream
    Write the length of the bit code to the level stream
Compress the level stream with a lossless algorithm
Write the frequency table to the output stream
Write the compressed level stream and the bit code stream to the output stream
```

DECODING

```
Read the frequency table from the input stream
Create a complete binary tree using the frequency table
Read the compressed level stream from the input stream
Uncompress the compressed level stream
Read the bit code stream from the input stream
While more levels to read from the level stream
    Read one level from the level stream
    Read level bits from bit code stream
    Find the symbol in the complete binary tree using the level and the bit code
    Write the symbol to the output stream
```

Table 3-6

Symbol	Frequency
<i>a</i>	32
<i>b</i>	55
<i>c</i>	4
<i>d</i>	19
<i>e</i>	37
<i>f</i>	26
<i>g</i>	9
<i>h</i>	7

If we now were to create a complete binary tree of Table 3-6, we would get the following tree:

Figure 3-5 Complete binary tree

Properties of Complete Binary Trees:

- All levels are completely full except possibly the lowest level.
- Filled from left to right at each level. i.e. Tree leans left.
- The number of nodes at level n is 2^n .

Table 3-6

Symbol	Frequency
<i>a</i>	32
<i>b</i>	55
<i>c</i>	4
<i>d</i>	19
<i>e</i>	37
<i>f</i>	26
<i>g</i>	9
<i>h</i>	7

If we now were to create a complete binary tree of Table 3-6, we would get the following tree:

Figure 3-5 Complete binary tree
